

It starts with you
You ask for something once. That is all you have to do.

Helpers do the running
Small AI helpers talk to nearby shops for you, like a friend making calls.

You see everything
Every step shows up on a live map, so nothing is hidden from you.

Example

No jargon. Just the idea.

Grid Pattern, made simple

What the Streetwise Grid is, how it works step by step, and why it is useful, explained in plain words for anyone.

what is inside

start here ↘

1. The idea in one line

in one line

> The Grid is a live map that shows small AI helpers finding the right shop (or person) for you, step by step, so you can see everything that happens.

Think of it like watching your food delivery on a map, but instead of a rider moving, you watch helpers asking shops, getting prices, checking for tricks and closing the deal for you.

imagine this ↘

2. A short story

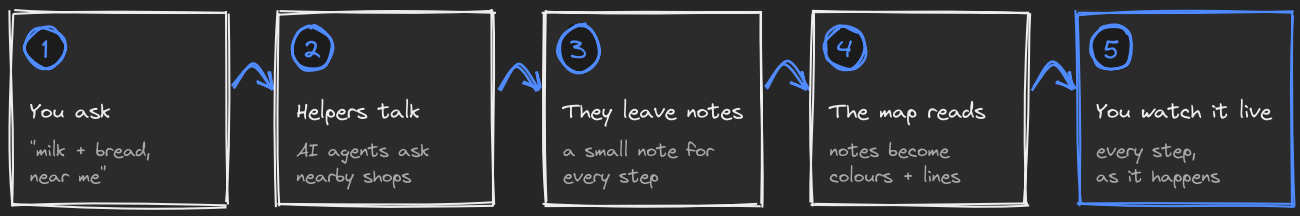

It is 9 pm. Riya needs milk and bread. She types one message: *"milk and bread near me"*.

- Her helper looks for shops very close to her first. Only one is close, and its shutter is down. So it looks a little further.
- It finds four shops and asks each one: "Do you have milk and bread? How much?"
- Three shops reply with a price. One stays silent, so it is skipped.
- One shop adds a hidden ₹30 packing fee. The safety checker blocks it.
- Riya sees two good options, picks the cheapest, and the shop owner taps YES on his phone.
- Riya gets a receipt, walks over and pays by UPI.

On the Grid map, all of this showed up live: the circle growing, shops lighting up, the red "blocked" dot, and the orange "chosen" shop.

the whole thing, drawn ↘

3. The big picture

Helpers do the work and leave small notes. The map turns the notes into a picture.

The most important idea: the helpers never draw the map. They just leave a small note for every step ("I asked this shop", "this shop said YES"). The map reads those notes and shows them. That is why the same map can later show other things too, like blood donors or EV chargers.

the characters ↘

4. Who is who

You (the one asking)

You say what you need, once, in normal words or even Hinglish.

Your helper

An AI helper that works for you. It understands your message and runs around for you.

Shop helpers

Every shop gets its own little AI helper. It knows the shop's prices and asks the owner before saying yes.

The shop owner

A real person. Gets a message on the phone and taps YES or NO. Nothing happens without them.

The safety checker

A helper whose only job is to protect you: no hidden fees, no closed shops, no wrong totals.

The Grid (the live map)

Shows all of the above as it happens: dots, circles, lines and a list of what just happened.

step by step ↘

5. How it works, in 8 steps

1 A shop joins

The shop gets its own AI helper by scanning a QR. Now it is a dot on the map.

2 You ask

"I need milk and bread." Your helper notes roughly where you are.

3 Look nearby

It looks 500 m around you, then 1 km, then 2 km, until it finds enough shops.

4 Ask the shops

Your helper asks each shop's helper: "Do you have this? How much?"

5 Shops reply

Each shop helper replies with a price. A shop that does not reply in time is skipped.

6 Owner says YES

The shop owner gets a message on the phone and taps YES (or NO).

7 Safety check

A checker helper blocks hidden fees, closed shops and wrong totals.

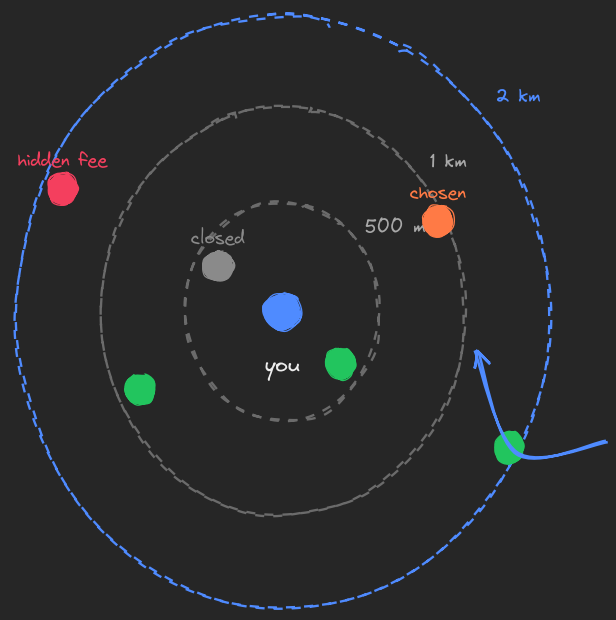

8 Done

You pick the best option. The order is confirmed, you get a receipt. The map shows it all.

From a shop joining to your receipt. Every step shows up on the map.

search smart ↘

6. Like ripples in a pond

Like a stone in a pond:

1. look very close first (500 m)
2. not enough shops? go a bit wider (1 km)
3. still not enough? go wider again (2 km)
4. stop as soon as 3 good shops answer

close shops = faster for you

Start close, go wider only when needed.

Throw a stone in a pond and the ripples grow outward. The Grid searches the same way. It starts with shops very close to you, because they are quickest to reach. If there are not enough, the circle grows. This keeps things fast and avoids bothering shops that are far away.

read the map ↘

7. What the colours mean

Colour	Meaning	Example
green	Open and available	Sharma Kirana is open
grey	Closed, or did not reply in time	Bansal Store has its shutter down
blue	A message going out or coming back	"Do you have milk?"
yellow	Waiting for the shop owner to tap YES	Owner is looking at the phone
red	Blocked by the safety checker	Hidden ₹30 packing fee
orange	Chosen, your order is with this shop	Your milk and bread

Next to the map there is a live list ("11:05 owner tapped YES") and a small score bar (orders done, money saved from hidden fees, shops online).

so what? ↘

8. Why it is useful

For buyers

- Ask once, get checked options
- No hidden fees
- See exactly what happened

For small shops

- Get orders without building an app
- The owner stays in control (YES / NO)
- Show up next to big platforms

For trust

- Every step is visible
- Bad behaviour is blocked and shown in red
- A receipt for every deal

For builders and judges

- You can watch AI helpers make decisions
- Easy to find problems
- Can replay any past order

not only shops ↘

9. Where else it can be used

Anything where someone needs something and there are many people nearby who could help:

Area	Example
Home services	"I need a plumber now": nearby plumbers' helpers reply, the first to say YES gets the job
Health	"Need O+ blood": find donors within 2 km, privately
Medicines	Which chemist nearby has this medicine in stock?
EV charging	Which charger is free right now, and at what price?
Farming	Rent a tractor from a nearby village
Jobs	Daily workers matched to nearby work
Food donation	Restaurants with extra food matched to nearby NGOs

honest answer ↘

10. Is this idea new?

Partly. Live maps already exist (Swiggy, Uber). Systems where computers ask each other for offers have existed since the 1980s. India's ONDC already connects buyers and sellers in an open way.

What is new here is putting it all together for small local shops: every shop gets its own AI helper, the owner confirms with one tap, a safety checker protects the buyer, and everyone can

watch it happen live on one map.

mini dictionary ↘

11. Words you may hear

Word	In simple words
AI agent	A small computer helper that can talk, decide simple things and act for someone
Node	One dot on the map: a shop, a person or a machine with its own helper
Ripple search	Look close first, then wider and wider
Event	A small note: "this just happened"
Live stream (SSE)	The server sends new notes to your browser the moment they happen, no refreshing
Trust check	Rules that block cheating: hidden fees, closed shops, wrong totals
H3	Dividing the map into small honeycomb tiles, so places are easy to group and keep private
Browser	Chrome, Safari, Firefox: the map runs right there, no app needed
Testnet FET	Practice crypto money used to test payments between helpers. It has no real value

you might ask ↘

12. Common questions

Do I need to install an app?

No. The Grid opens in a normal web browser, on a phone or a laptop.

Can anyone see where I live?

No. Your location is shown only as a rough area (a honeycomb tile), never as an exact point.

What if a shop does not reply?

It gets a time limit. If it is silent, it turns grey and the search moves on.

Who decides the order?

You pick the option, and the shop owner taps YES. The AI helpers only do the running around.

What if the Grid map stops working?

Orders still go through. The map only watches; it never blocks a deal.

keep this page ↘

13. Everything on one page

What

A live map of AI helpers finding the right shop for you.

How

Look close, then wider. Ask shops. Owner says YES. Checker blocks tricks. Done.

Why

Faster, fair, nothing hidden, and small shops get a fair chance.

Where next

Plumbers, medicines, blood donors, EV chargers, tractors, food donation.

in one line

You ask once. Helpers do the running. The checker keeps it fair. The Grid lets you watch it all, live.
